NSWBA List of the Birds of New South Wales, the Australian Capital Territory & Lord Howe Island Group

Dick Cooper

The New South Wales Bird Atlassers Inc. (NSWBA) was established in 1982 with aims focussed on monitoring the distribution of birds in New South Wales (including the Lord Howe group) and the Australian Capital Territory. To achieve this, the NSWBA established and maintains a comprehensive database on the occurrence, breeding and non-breeding distribution of those birds recorded within the area concerned.

For this purpose the NSWBA needs to have ready access to, and maintain, an accurate list of those species and subspecies of birds reported to occur in NSW, including Lord Howe Island, the Tasman Sea from the NSW coast to 200 kms offshore, Elizabeth and Middleton Reef Marine National Nature Reserve, and the ACT.

Introduced birds, aviary releases/escapes and feral and hybrid populations are also considered important as are species and subspecies that no longer occur within the region and birds incorrectly reported as occurring here.

Six hundred birds have been recorded in the NSWBA area of interest. Twenty-four percent (24%) of these birds are not listed on the NSWBA Atlas Sheet because they are rare, vagrant or infrequently reported. For each of these birds the NSWBA may require supporting information and Atlassers are encouraged to take detailed notes and photographs of their observations of these birds and include same with the Atlas Sheet. Apart from the NSWBA Vetting Committee, there are two other groups that seek information on rare or vagrant species. There are **BARC** - Birdlife Australia Rarities Committee and **NSWORAC** - NSW Ornithological Records Appraisal Committee.

The NSWBA Bird List largely follows the order applied using the taxonomy recommended by Birdlife Australia's WLAB V4.1. Taxonomy classifies living organisms into families, species, subspecies etc. and aids identification of species, helps understand their relationships, the needs of specific organisms and can aid conservation, however, taxonomy is not static and scientists continue to explore genetic, physiological, and morphological evidence. Australia is presently experiencing a period of extensive taxonomic change though not every taxonomic findings is accepted universally. This means that different organisations may have bird lists that vary. The NSW Bird Atlassers bird list aims to provide members and other birders with a current list of birds found in our area of interest as well as other information, i.e. it is a multi-functional document.

At the basic level, it lists, under the heading '**NSW**', all birds accepted as occurring within the NSWBA area of interest, as indicated above, and whether each species occurs regularly (shown as 'X') or as a 'Vagrant'. A 2nd column, headed '**LHI**' identifies those species/subspecies regularly occurring on Lord Howe Island and other islands of that group. Both lists reflect currently accepted taxonomic status for each bird and subspecies though the names listed are considered the most practical common names used by birders for Australian bird species.

The list also indicates in the '**Comments**' column those species assessed as threatened species under NSW and/or ACT legislation, indicating the assessed threat status using the abbreviations of 'Ex' - Extinct, 'CE' - Critically Endangered; 'E' - Endangered, 'V' - Vulnerable. Where a threat assessment is only contained in the national Environment Protection and Biodiversity Conservation (EPBC) Act 1999, that species' status is included. There are other several items included in the '**Comments**' column. There are:

- * the scientific name(s) of the subspecies known to occur within the NSWBA area of interest, where there is more than one subspecies in Australia;
- * alternate common names used in WLAB V4.1 - highlighted in Bold, or by the IOC - highlight in bold on a yellow background;
- * introduced/feral species are indicated as '**Introduced**' and, where possible, the relevant subspecies is identified. '**ssp?**' indicates that the subspecies is not known;

- * the key Bio-geographic regions that the bird is known to frequent (refer Vol. 1 of the NSW/ACT Atlas for full details);
- * for rare and vagrant species, this column includes an abbreviated indication of the nominated appraisal group, as follows - NSWBA, BARC or NSWORAC; and
- * other helpful information about some species is included within a **green background**.

This approach means we provide as much detail as practical about any species/subspecies to better inform members and other users.
